

线性代数常考题型解法

一、行列式计算 纯数字四阶行列式应用 $r_i + kr_j$ 变换成三角阵。

1. 4阶行列式 例1.
$$\begin{vmatrix} x & y & y & y \\ y & x & y & y \\ y & y & x & y \\ y & y & y & x \end{vmatrix} \xrightarrow[r_1 \div (x+3y)]{r_1+r_2+r_3+r_4} (x+3y) \begin{vmatrix} 1 & 1 & 1 & 1 \\ y & x & y & y \\ y & y & x & y \\ y & y & y & x \end{vmatrix}$$

$$\xrightarrow[r_4 - y r_1]{\substack{r_2 - y r_1 \\ r_3 - y r_1}} (x+3y) \begin{vmatrix} 1 & 1 & 1 & 1 \\ 0 & x-y & 0 & 0 \\ 0 & 0 & x-y & 0 \\ 0 & 0 & 0 & x-y \end{vmatrix} = (x+3y)(x-y)^3$$

例2.
$$\begin{vmatrix} a+x & b & c & d \\ a & b+x & c & d \\ a & b & c+x & d \\ a & b & c & d+x \end{vmatrix} \xrightarrow[c_1 \div (a+b+c+d+x)]{c_1+c_2+c_3+c_4} [a+b+c+d+x] \begin{vmatrix} 1 & b & c & d \\ 1 & b+x & c & d \\ 1 & b & c+x & d \\ 1 & b & c & d+x \end{vmatrix}$$

$$\xrightarrow[c_4 - d c_1]{\substack{c_2 - b c_1 \\ c_3 - c c_1}} [a+b+c+d+x] \begin{vmatrix} 1 & 0 & 0 & 0 \\ 1 & x & 0 & 0 \\ 1 & 0 & x & 0 \\ 1 & 0 & 0 & x \end{vmatrix} = x^3(a+b+c+d+x)$$

二、与行列式有关的概念是

1. $V_n = \begin{vmatrix} 1 & 1 & \dots & 1 \\ x_1 & x_2 & \dots & x_n \\ \vdots & \vdots & \ddots & \vdots \\ x_1^{n-1} & x_2^{n-1} & \dots & x_n^{n-1} \end{vmatrix} \xrightarrow{\text{范德蒙德行列式}} \text{第一行} (x_n - x_{n-1})(x_n - x_{n-2}) \dots (x_n - x_1)(x_{n-1} - x_{n-2}) \dots (x_{n-1} - x_1) \dots (x_2 - x_1)$

2. $|\lambda A|^n = \lambda^n |A|^n$. $|AB| = |A||B| = |BA|$ (A, B 同阶方阵) $|A^*| = |A| \cdot |A^{-1}| = |A|^{n-1}$
 $|A^{-1}| = \frac{1}{|A|}$ $|A^*| = |A|^{n-1}$ $|(\lambda A)^{-1}| = |\frac{1}{\lambda} A^{-1}| = \frac{1}{\lambda^n} \cdot \frac{1}{|A|}$

3. A为3阶方阵. $|A|=a$ 求 $|\lambda A^* + \mu A^{-1}| = \frac{|A|}{|A|} |\lambda A^* + \mu A^{-1}| = \frac{1}{|A|} |A(\lambda A^* + \mu A^{-1})|$

4. A特征值 $\lambda_1, \lambda_2, \lambda_3$ 求 $|A^2 + 3A - 2E|$
 $|A| = \lambda_1 \lambda_2 \lambda_3$ $\therefore A^2 + 3A - 2E$ 特征值为
 $\varphi(\lambda_i) = \lambda_i^2 + 3\lambda_i - 2 \ (i=1,2,3) \therefore |A^2 + 3A - 2E| = \varphi(\lambda_1) \varphi(\lambda_2) \varphi(\lambda_3)$

$$= \frac{1}{a} |\lambda A^* A + \mu A A^{-1}| = \frac{1}{a} |\lambda |A| E + \mu E| = \frac{1}{a} |(\lambda a + \mu) E| = \frac{1}{a} (\lambda a + \mu)^3$$

5. $A = (\alpha_1, \alpha_2, \alpha_3)$ $|A|=a$ 求 $B = (\alpha_2 + 2\alpha_3, \alpha_3 - \alpha_1, \alpha_1)$ 的行列式

法一. $B = (\alpha_1, \alpha_2, \alpha_3) \begin{pmatrix} 0 & -1 & 1 \\ 1 & 0 & 0 \\ 2 & 1 & 0 \end{pmatrix} \therefore |B| = |(\alpha_1, \alpha_2, \alpha_3)| \begin{vmatrix} 0 & -1 & 1 \\ 1 & 0 & 0 \\ 2 & 1 & 0 \end{vmatrix} = +a$ 法二. $|B| = |(\alpha_2 + 2\alpha_3, \alpha_3 - \alpha_1, \alpha_1)| \xrightarrow[c_1 \leftrightarrow c_2]{\substack{c_2 \leftrightarrow c_3 \\ c_1 - 3c_2}} |(\alpha_2, \alpha_3, \alpha_1)| \xrightarrow[c_1 \leftrightarrow c_2]{c_2 \leftrightarrow c_3} a$

三. 解) $AX=B$ 法: $(A, B) \xrightarrow{r} (E, A^{-1}B) \therefore X=A^{-1}B$ 法: $\because |A|=a \neq 0 \therefore A$ 可逆
 $A^{-1}=\frac{A^*}{|A|} \therefore X=A^{-1}B=$

例1. $A=\begin{pmatrix} 3 & 1 & -3 \\ 1 & 3 & -2 \\ -1 & 3 & 3 \end{pmatrix} B=\begin{pmatrix} 1 & -1 \\ 2 & 0 \\ -2 & 5 \end{pmatrix}$ 求解 $AX=X+B$

解: 由 $AX=X+B \Rightarrow (A-E)X=B$ 又 $(A-E, B)=\begin{pmatrix} 2 & 1 & -3 & 1 & -1 \\ 1 & 2 & -2 & 2 & 0 \\ 1 & 3 & 2 & -2 & 5 \end{pmatrix} \xrightarrow{r} \begin{pmatrix} 1 & 0 & 0 & -4 & 2 \\ 0 & 1 & 0 & 0 & 1 \\ 0 & 0 & 1 & 3 & 2 \end{pmatrix}$

$\therefore X=\begin{pmatrix} -4 & 2 \\ 0 & 1 \\ 3 & 2 \end{pmatrix}$

$X=(A-E)^{-1}B$
 $=\begin{pmatrix} 2 & 1 & -3 & 1 & -1 \\ 1 & 2 & -2 & 2 & 0 \\ -1 & 3 & 2 & -2 & 5 \end{pmatrix} \rightarrow$

例) $A=\begin{pmatrix} 2 & 0 & 0 \\ 1 & 3 & 0 \\ 1 & 2 & 4 \end{pmatrix}$ 求解 $AX=X+E$

解: 由 $AX=X+E \Rightarrow (A-E)X=E$ $\therefore |A-E|=\begin{vmatrix} 1 & 0 & 0 \\ 1 & 2 & 0 \\ 1 & 2 & 3 \end{vmatrix}=6 \neq 0$

$\therefore A-E$ 可逆且 $(A-E)^{-1}=\frac{1}{|A-E|}(A-E)^*=\frac{1}{6}\begin{pmatrix} 6 & 0 & 0 \\ -3 & 3 & 0 \\ 0 & -2 & 2 \end{pmatrix} \therefore X=(A-E)^{-1}E$

四. 已知 $\alpha_1, \alpha_2, \alpha_3$ 线性无关. 求证 $\beta_1=$ $\beta_2=$ $\beta_3=$ 线性无关相关.

法一: 设 $x_1\beta_1+x_2\beta_2+x_3\beta_3=0 \Rightarrow y_1(x)\alpha_1+y_2(x)\alpha_2+y_3(x)\alpha_3=0$

$\because \alpha_1, \alpha_2, \alpha_3$ 线性无关 $\therefore \begin{cases} y_1(x)=0 \\ y_2(x)=0 \\ y_3(x)=0 \end{cases} \therefore$ 系数行列式 $D=\begin{cases} a \neq 0 \therefore X=0 \\ 0 \therefore$ 有非0的 $X \neq 0$

$\therefore \begin{cases} \beta_1, \beta_2, \beta_3 \text{ 线性无关} \\ \beta_1, \beta_2, \beta_3 \text{ 线性相关} \end{cases}$

法二: $\because (\beta_1, \beta_2, \beta_3)=(\alpha_1, \alpha_2, \alpha_3)\begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{pmatrix} \therefore \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} \neq 0 \therefore \begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{pmatrix}$ 可逆

$\therefore R(\beta_1, \beta_2, \beta_3)=R(\alpha_1, \alpha_2, \alpha_3)=3 \therefore \beta_1, \beta_2, \beta_3$ 线性无关

例) $\alpha_1, \alpha_2, \alpha_3$ 线性无关 求证 $\beta_1=\alpha_2-\alpha_1$ $\beta_2=3\alpha_3-\alpha_2$ $\beta_3=\alpha_1-2\alpha_2+\alpha_3$ 线性无关

证: 令 $x_1\beta_1+x_2\beta_2+x_3\beta_3=0 \Rightarrow x_1(\alpha_2-\alpha_1)+x_2(3\alpha_3-\alpha_2)+x_3(\alpha_1-2\alpha_2+\alpha_3)=0$

$\Rightarrow (-x_1+x_3)\alpha_1+(x_1-x_2-2x_3)\alpha_2+(3x_2+x_3)\alpha_3=0$

$\because \alpha_1, \alpha_2, \alpha_3$ 线性无关 $\therefore \begin{cases} -x_1+x_3=0 \\ x_1-x_2-2x_3=0 \\ 3x_2+x_3=0 \end{cases} \therefore D=\begin{vmatrix} -1 & 0 & 1 \\ 1 & -1 & -2 \\ 0 & 3 & 1 \end{vmatrix}=-2 \neq 0 \therefore$ 只有0解
 $\therefore \beta_1, \beta_2, \beta_3$ 无关

法二: $\because (\beta_1, \beta_2, \beta_3)=(\alpha_1, \alpha_2, \alpha_3)\begin{pmatrix} -1 & 0 & 1 \\ 1 & -1 & -2 \\ 0 & 3 & 1 \end{pmatrix} \therefore \begin{vmatrix} -1 & 0 & 1 \\ 1 & -1 & -2 \\ 0 & 3 & 1 \end{vmatrix}=-2 \neq 0 \therefore \begin{pmatrix} -1 & 0 & 1 \\ 1 & -1 & -2 \\ 0 & 3 & 1 \end{pmatrix}$ 可逆

又 $R(\alpha_1, \alpha_2, \alpha_3)=3$

$\therefore R(\beta_1, \beta_2, \beta_3)=R(\alpha_1, \alpha_2, \alpha_3)=3 \therefore \beta_1, \beta_2, \beta_3$ 线性无关

五: 给定 $\alpha_1, \alpha_2, \alpha_3, \alpha_4$ ①求其秩 ②求一个极大无关组 ③把其余向量用极大无关组线性表示. 例法 $A=(\alpha_1, \alpha_2, \alpha_3, \alpha_4)$ 行变 $\rightarrow$ 行最简. 据此给出结论

例 $\alpha_1=(1,1,1,2)^T$ $\alpha_2=(3,1,2,5)^T$ $\alpha_3=(2,0,1,3)^T$ $\alpha_4=(1,-1,0,1)^T$

解: $\because (\alpha_1, \alpha_2, \alpha_3, \alpha_4) = \begin{pmatrix} 1 & 3 & 2 & 1 \\ 1 & 1 & 0 & -1 \\ 1 & 2 & 1 & 0 \\ 2 & 5 & 3 & 1 \end{pmatrix} \xrightarrow{\substack{r_2-r_1 \\ r_3-r_1 \\ r_4-2r_1}} \begin{pmatrix} 1 & 3 & 2 & 1 \\ 0 & -2 & -2 & -2 \\ 0 & -1 & -1 & -1 \\ 0 & -1 & -1 & -1 \end{pmatrix} \xrightarrow{r} \begin{pmatrix} 1 & 0 & -1 & -2 \\ 0 & 1 & 1 & 1 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}$

$\therefore R(\alpha_1, \alpha_2, \alpha_3, \alpha_4) = 2$, α_1, α_2 是一个极大无关组 $\begin{cases} \alpha_3 = -\alpha_1 + \alpha_2 \\ \alpha_4 = 2\alpha_1 + \alpha_2 \end{cases}$ 或 $(\alpha_3, \alpha_4) = (\alpha_1, \alpha_2) \begin{pmatrix} -1 & 1 \\ 2 & 1 \end{pmatrix}$

若 $\begin{pmatrix} 1 & 0 & a & 0 \\ 0 & 1 & b & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 \end{pmatrix}$ 则 $R(\alpha_1, \alpha_2, \alpha_3, \alpha_4) = 3$. $\alpha_1, \alpha_2, \alpha_4$ 是一个极大无关组 $\alpha_3 = a\alpha_1 + b\alpha_2$ $\alpha_3 = (\alpha_1, \alpha_2) \begin{pmatrix} a \\ b \end{pmatrix}$

六: 与秩相关的概念题.

1. $R(A)=r$ 则 $R(A^*) = \begin{cases} n & r=n \\ 1 & r=n-1 \\ 0 & r \leq n-2 \end{cases}$

2. B 可逆 则 $R(A)=R(AB)$
 A 可逆 $R(AB)=R(B)$

3. $AX=b$ $R(A)=R(B)=r = \begin{cases} n & \text{有唯一解} \\ < n & \text{有无穷解} \\ \text{不等} & \text{无解} \end{cases}$

$AX=0$ $R(A)=r = \begin{cases} = n & \text{只有0解} \\ < n & \text{有非0解} \end{cases}$

4. $R(\alpha_1, \alpha_2, \dots, \alpha_m) = r = \begin{cases} < m & \text{线性相关} \\ = m & \text{线性无关} \end{cases}$

5. A 可逆时 $R = \begin{cases} 3 \\ 2 \\ 1 \end{cases}$ $|A| \neq 0$ $R=3$. $R=2$ 及 $R=1$ 讨论参数对应的 A

6. $AX=b$ 若 $R(A)=R(b)=r < n$ 则 $AX=0$ 基础解系含 $n-r$ 个解向量 $\xi_1, \dots, \xi_{n-r}$
 $AX=b$ 特解 ξ^* 通解为 $X = \xi^* + c_1 \xi_1 + \dots + c_{n-r} \xi_{n-r}$

例 $AX=b$ 是4元方程组, $\alpha_1, \alpha_2, \alpha_3$ 是其三个解向量. $R(A)=3$. 已知 α_1 及 $\alpha_2 + \alpha_3$
则 $AX=b$ 通解为 $X = \alpha_1 + k(\alpha_2 + \alpha_3 - 2\alpha_1)$ 或 $\alpha_1 + k(2\alpha_1 - \alpha_2 - \alpha_3)$

另 η_1, η_2, η_3 是 $AX=b$ 的解 $\Rightarrow A\eta_i = b$ $A(k_1\eta_1 + k_2\eta_2 + k_3\eta_3) = (k_1 + k_2 + k_3)b$

$\Rightarrow k_1\eta_1 + k_2\eta_2 + k_3\eta_3$ 是 $AX = (k_1 + k_2 + k_3)b$ 的解 $k_1 + k_2 + k_3 = \begin{cases} 1 & AX=b \text{ 的解} \\ 0 & AX=0 \text{ 的解} \end{cases}$

七. A 含参数 λ $AX=b$ 何时解唯一 - (2) 无解 (3) 无穷多解并讨论

法 - (A, b) 行最简 讨论 λ (1) $R(A)=R(B)=3$ 唯一
(2) $R(A)<R(B)$ 无解 (3) $R(A)=R(B)<3$ 无穷解

法 = : $(A$ 阵) $\therefore |A|=(\lambda-\lambda_1)(\lambda-\lambda_2) \therefore \lambda \neq \lambda_1$ 且 $\lambda \neq \lambda_2$ 时有唯一 -

又 $\lambda=\lambda_1$ 时 $(A, b) \xrightarrow{r}$ 行阶梯 $\therefore R(A)<R(B)$ 无解

$\lambda=\lambda_2$ 时 $(A, b) \xrightarrow{r}$ 行最简 $\therefore R(A)=R(B)<3$ 有无穷多解: 解 $B, X=b$

例 | $\begin{cases} (2-\lambda)x_1 + 2x_2 - 2x_3 = 1 \\ 2x_1 + (5-\lambda)x_2 - 4x_3 = 2 \\ -2x_1 - 4x_2 + (5-\lambda)x_3 = -\lambda-1 \end{cases}$ (1) 唯一 (2) 无解 (3) 无穷多解并讨论

$$\text{解: } \therefore |A| = \begin{vmatrix} 2-\lambda & 2 & -2 \\ 2 & 5-\lambda & -4 \\ -2 & -4 & 5-\lambda \end{vmatrix} \xrightarrow{r_3+r_2} \begin{vmatrix} 2-\lambda & 2 & -2 \\ 2 & 5-\lambda & -4 \\ 0 & 1-\lambda & 1-\lambda \end{vmatrix} = (1-\lambda) \begin{vmatrix} 2-\lambda & 2 & -2 \\ 2 & 5-\lambda & -4 \\ 0 & 1 & 1 \end{vmatrix} = (1-\lambda)^2(10-\lambda)$$

$\therefore \lambda \neq 1$ 且 $\lambda \neq 10$ 时有唯一解

$$\text{又 } \lambda=10 \text{ 时 } B = \begin{pmatrix} -8 & 2 & -2 & 1 \\ 2 & -5 & -4 & 2 \\ -2 & -4 & -5 & -11 \end{pmatrix} \xrightarrow{\substack{r_3+r_2 \\ r_1+r_2}} \begin{pmatrix} 0 & -18 & -18 & 9 \\ 2 & -5 & -4 & 2 \\ 0 & -9 & -9 & -9 \end{pmatrix} \xrightarrow{r} \begin{pmatrix} 2 & -5 & -4 & 2 \\ 0 & 1 & 1 & 1 \\ 0 & 0 & 0 & 27 \end{pmatrix}$$

$\therefore R(A)=2 < R(B)=3$ 此时无解

$$\text{当 } \lambda=1 \text{ 时 } B = \begin{pmatrix} 1 & 2 & -2 & 1 \\ 2 & 4 & -4 & 2 \\ -2 & -4 & 4 & -2 \end{pmatrix} \xrightarrow{r} \begin{pmatrix} 1 & 2 & -2 & 1 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix} \text{ (1) } \therefore R(A)=R(B)=1 < 3 \text{ 有无穷多解}$$

$$\text{由 (1) } \begin{cases} x_1 + 2x_2 - 2x_3 = 1 \\ x_1 = -2x_2 + 2x_3 + 1 \end{cases} \text{ 令 } \begin{pmatrix} x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix}, \begin{pmatrix} 0 \\ 1 \end{pmatrix} \text{ 得 } AX=0$$

$$\text{基础解系 } \xi_1 = \begin{pmatrix} -2 \\ 1 \\ 0 \end{pmatrix}, \xi_2 = \begin{pmatrix} 2 \\ 0 \\ 1 \end{pmatrix} \text{ 令 } \begin{pmatrix} x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \end{pmatrix} \text{ 得 } AX=b \text{ 特解 } \eta^* = \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}$$

$$\therefore \text{通解为 } X = \eta^* + C_1 \xi_1 + C_2 \xi_2 = \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} + C_1 \begin{pmatrix} -2 \\ 1 \\ 0 \end{pmatrix} + C_2 \begin{pmatrix} 2 \\ 0 \\ 1 \end{pmatrix}$$

$$\text{令 } x_2 = C_1, x_3 = C_2 \text{ 得通解为 } \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} -2C_1 + 2C_2 + 1 \\ C_1 \\ C_2 \end{pmatrix} = C_1 \begin{pmatrix} -2 \\ 1 \\ 0 \end{pmatrix} + C_2 \begin{pmatrix} 2 \\ 0 \\ 1 \end{pmatrix} + \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}$$

$$\text{若 } B \xrightarrow{r} \begin{pmatrix} 1 & 0 & 1 & 2 \\ 0 & 1 & 0 & 1 \\ 0 & 0 & 0 & 0 \end{pmatrix} \Rightarrow \begin{cases} x_1 + x_3 = 2 \\ x_2 = 1 \end{cases} \Rightarrow \begin{cases} x_1 = 2 - x_3 \\ x_2 = 1 \end{cases} \text{ 令 } x_3 = C \text{ 得通解}$$

$$\begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 2-C \\ 1 \\ C \end{pmatrix} = C \begin{pmatrix} -1 \\ 0 \\ 1 \end{pmatrix} + \begin{pmatrix} 2 \\ 1 \\ 0 \end{pmatrix}$$

八 求三阶方阵 A 的特征值与特征向量 A 可对角化. 理由?

方法: $\because |A - \lambda E| = (\lambda - \lambda_1)(\lambda - \lambda_2)^2 \therefore$ 特征值 $\lambda_1 = ? \lambda_2 = ?$

对于 λ_1 $A - \lambda_1 E \xrightarrow{r} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{pmatrix} \Rightarrow \begin{cases} x_1 = 0 \\ x_2 = 0 \end{cases}$ 令 $x_3 = 1$ 得 $p_1 = \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix}$ $\therefore$ 对应于 λ_1 的特征向量
为 $C_1 p_1$ ($C_1 \neq 0$)

情形1: 对于 λ_2 $A - \lambda_2 E \xrightarrow{r} \begin{pmatrix} 1 & 0 & 1 \\ 0 & 1 & 2 \\ 0 & 0 & 0 \end{pmatrix} \Rightarrow \begin{cases} x_1 = -x_3 \\ x_2 = -2x_3 \end{cases}$ 令 $x_3 = -1$ 得 $p_2 = \begin{pmatrix} 1 \\ 2 \\ -1 \end{pmatrix}$ $\therefore$ 对应 λ_2 的特征向量
 $C_2 p_2$ ($C_2 \neq 0$) $\therefore$ 只有2个线性无关的特征向量: 不可对角化

情形2: $A \xrightarrow{r} \begin{pmatrix} 1 & a & b \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} \Rightarrow x_1 = -ax_2 - bx_3$ 令 $\begin{pmatrix} x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix}, \begin{pmatrix} 0 \\ 1 \end{pmatrix}$ 得 $p_2 = \begin{pmatrix} -a \\ 1 \\ 0 \end{pmatrix}, p_3 = \begin{pmatrix} -b \\ 0 \\ 1 \end{pmatrix}$
 $\therefore$ 特征向量 $C_2 p_2 + C_3 p_3$ ($C_2^2 + C_3^2 \neq 0$) $\therefore$ 有三个特征向量 故可对角化

例: $A = \begin{pmatrix} 3 & 0 & 2 \\ 0 & 2 & 0 \\ 2 & 0 & 3 \end{pmatrix}$ 求特征值与特征向量, 可否对角化, 为什么

解: $|A - \lambda E| = \begin{vmatrix} 3-\lambda & 0 & 2 \\ 0 & 2-\lambda & 0 \\ 2 & 0 & 3-\lambda \end{vmatrix} = (2-\lambda)(5-\lambda)(1-\lambda) \therefore$ 特征值 $\lambda_1 = 1, \lambda_2 = 2, \lambda_3 = 5$
 $\therefore$ 有三个特征值 故可对角化

对 $\lambda_1 = 1$ $A - \lambda_1 E = \begin{pmatrix} 2 & 0 & 2 \\ 0 & 1 & 0 \\ 2 & 0 & 2 \end{pmatrix} \xrightarrow{r} \begin{pmatrix} 1 & 0 & 1 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{pmatrix} \Rightarrow \begin{cases} x_1 + x_3 = 0 \\ x_2 = 0 \end{cases}$ 令 $x_3 = 1 \Rightarrow p_1 = \begin{pmatrix} -1 \\ 0 \\ 1 \end{pmatrix} \therefore$ 相应特征向量 $C_1 p_1$ ($C_1 \neq 0$)

对 $\lambda_2 = 2$ $A - \lambda_2 E = \begin{pmatrix} 1 & 0 & 2 \\ 0 & 0 & 0 \\ 2 & 0 & 1 \end{pmatrix} \xrightarrow{r} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} \Rightarrow \begin{cases} x_1 = 0 \\ x_3 = 0 \end{cases}$ 令 $x_2 = 1 \Rightarrow p_2 = \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix} \therefore$ 相应 $\lambda_2 = 2 \dots C_2 p_2$ ($C_2 \neq 0$)

对 $\lambda_3 = 5$ $A - \lambda_3 E = \begin{pmatrix} -2 & 0 & 2 \\ 0 & -3 & 0 \\ 2 & 0 & -2 \end{pmatrix} \xrightarrow{r} \begin{pmatrix} 1 & 0 & -1 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{pmatrix} \Rightarrow \begin{cases} x_1 = x_3 \\ x_2 = 0 \end{cases} \Rightarrow p_3 = \begin{pmatrix} 1 \\ 0 \\ 1 \end{pmatrix} \therefore$ 相应 $\lambda_3 = 5$ 特征向量 $C_3 p_3$ ($C_3 \neq 0$)
